

UNDERLINING

It's no secret that optical character recognition (OCR) page readers can more than double the throughput of word processing systems.

Since its introduction, TYPEREADER 2 OCR from HENDRIX has enabled every secretary to type rough draft copy which is then scanned directly into the word processing system. Keyboarding original copy on the word processor is eliminated and word processing work stations can be used exclusively for revision typing.

But, if you were waiting for a page reader that can read the way your typists type, with no format restrictions, wait no longer . . . the secret is out!

The secret is out!

So you thought all OCR page readers could read and process underlined copy. Well they can't!

TYPEREADER 2 is the first low cost page reader in the world that can read and process single-spaced underlined typing in either 10 or 12 pitch.

Now, with the optional underline-processing feature, your typists can type first-time-for-final in addition to rough draft. The TYPEREADER 2 will read and process both, and your word processing productivity will take another quantum jump!

If you need underlining for reports, legal briefs, contracts, or just for emphasis, finally there's an OCR for you...

TYPEREADER 2 with optional underlining.

And you'll be in good company. TYPEREADER 2 is already being used to enhance thousands of word processing systems, and is the choice of more than three out of four new OCR users.

TYPEREADER 2 is sold and serviced by most word processing systems manufacturers. HENDRIX also provides interfaces for IBM, WANG, XEROX, and DEC systems.

Ask your word processing supplier about TYPEREADER 2 or write for more information.

HENDRIX

Taking technology beyond words.
